Enterprise Disaster Recovery Plan

Standard Operating Template & Guidelines

1. Purpose & Objectives

The primary purpose of this Disaster Recovery (DR) Plan is to minimize financial loss, maintain regulatory compliance, and ensure the rapid restoration of critical business infrastructure and data in the event of a disruptive crisis.

- **Recovery Point Objective (RPO):** Defines the maximum acceptable age of data that can be restored (e.g., maximum 4 hours of data loss).
- **Recovery Time Objective (RTO):** Defines the maximum acceptable duration of downtime before services must be fully operational (e.g., 2 hours).

2. Disaster Recovery Team & Roles

In the event of an emergency, the following roles are responsible for executing assessment, declaration, and mitigation protocols.

Role / Title	Primary Responsibility	Escalation Contact
DR Coordinator	Declares disaster state, oversees overall execution strategy, communicates with executive board.	dr-coordinator@company.com
Infrastructure Lead	Assesses hardware, cloud environment, networks, and initiates core systems restore.	infra-team@company.com
Database Admin	Verifies data integrity, recovers transaction logs, executes multi-region DB failover.	dba-team@company.com
Communications Lead	Manages internal communications and provides external updates to clients and stakeholders.	pr@company.com

3. Step-by-Step Recovery Phases

Phase 1: Identification & Assessment

1. Detect anomalies via automated system alerts or user escalation reports.
2. Verify the scale of outage (localized network failure vs. comprehensive site disaster).
3. Convene the DR Team within 15 minutes of anomaly verification.

Phase 2: Activation & Failover

1. Officially declare a state of disaster if system restoration cannot be completed within RTO targets via normal support channels.
2. Divert DNS traffic from the primary node to the secondary or secondary cloud failover region.
3. Re-target applications to point to the replica read/write databases.

Phase 3: Clean-up & Failback

1. Address the root cause of the primary facility failure and ensure the environment is clean.
2. Sync differential data accumulated in the backup region back to the primary location.
3. Execute a planned switchback window to return operations to normal.

4. Plan Testing & Maintenance Schedule

A disaster plan is only effective if regularly validated. The following testing cadences are strictly mandated:

• **Tabletop Exercises:** Conducted quarterly to review team assignments, communication pathways, and escalation procedures.

• **Technical Failover Drills:** Conducted semi-annually during off-peak windows to physically test secondary site replication and system boot speeds.
